

8Mb Async. FAST SRAM B-die

Asynchronous FAST SRAM

1.65V ~ 3.6V

- **S6R8016W1B**
- **S6R8008W1B**

Datasheet

Features

- Fast Access Time : 8ns, 10ns, 12ns
- Wide range of Power Supply
- 1.65V ~ 3.6V
- TTL Compatible Inputs and Outputs
- Three State Outputs
- Data Byte Control(x16 Mode)
 \overline{LB} : I/O7~ I/O0, \overline{UB} : I/O15~ I/O8
- Standard 44 TSOP2 and 48FBGA Package
- ROHS compliant
- Operating in Industrial Temperature range

General Description

The S6R8016W1B and S6R8008W1B are a 8,388,608-bit high-speed Static Random Access Memory organized as 512K (1M) words by 16(8) bits. The S6R8016W1B (S6R8008W1B) uses 16(8) common input and output lines and have an output enable pin which operates faster than address access time at read cycle. And S6R8016W1B allows that lower and upper byte access by data byte control(\overline{LB} , \overline{UB}). The device is fabricated using advanced CMOS process, 6-TR based cell technology and designed for high-speed circuit technology.

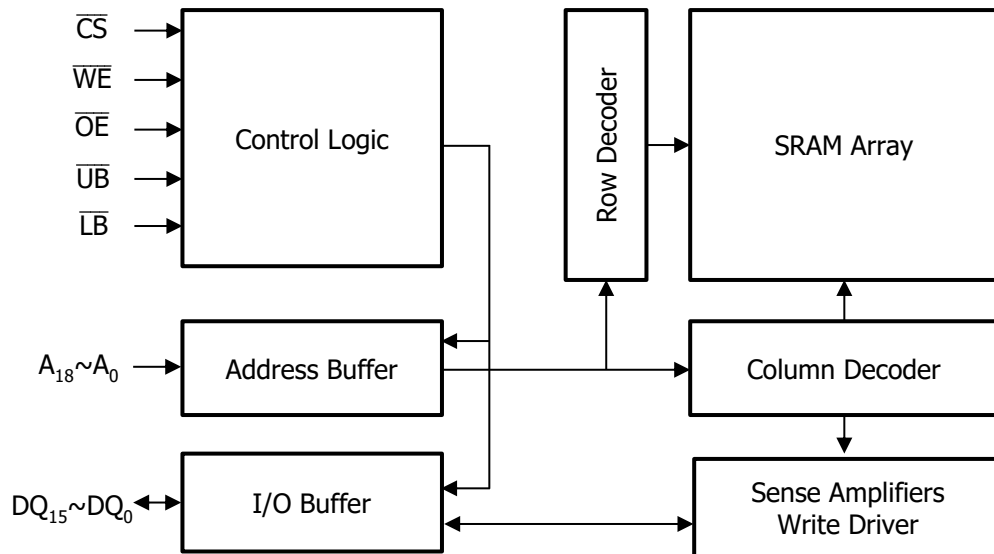

It is particularly well suited for use in high-reliable and high-speed system applications.

The S6R8016W1B and S6R8008W1B are packaged in a 400mil 44-pin TSOP2 and 48 Ball FBGA.

Timing Diagrams

Timing Waveform of Read Cycle(1) (Address Controlled, $\overline{CS} = \overline{OE} = VIL$, $\overline{WE} = VIH$, \overline{UB} , $\overline{LB} = VIL$ ¹⁾)

Notes:

1. Those parameters are applied for x16 mode only.

Timing Waveform of Read Cycle(2) ($\overline{WE} = VIH$)

Notes (Read Cycle)

1. \overline{WE} is high for read cycle.
2. All read cycle timing is referenced from the last valid address to the first transition address.
3. t_{HZ} and t_{OHZ} are defined as the time at which the outputs achieve the open circuit condition and are not referenced to V_{OH} or V_{OL} levels.
4. At any given temperature and voltage condition, $t_{HZ}(\text{Max.})$ is less than $t_{LZ}(\text{Min.})$ both for a given device and from device to device.
5. Transition is measured $\pm 200\text{mV}$ from steady state voltage with Load(B). This parameter is sampled and not 100% tested.
6. Device is continuously selected with $\overline{CS} = VIL$.
7. Address valid prior to coincident with \overline{CS} transition low.
8. For common DQ applications, minimization or elimination of bus contention conditions is necessary during read and write cycle.

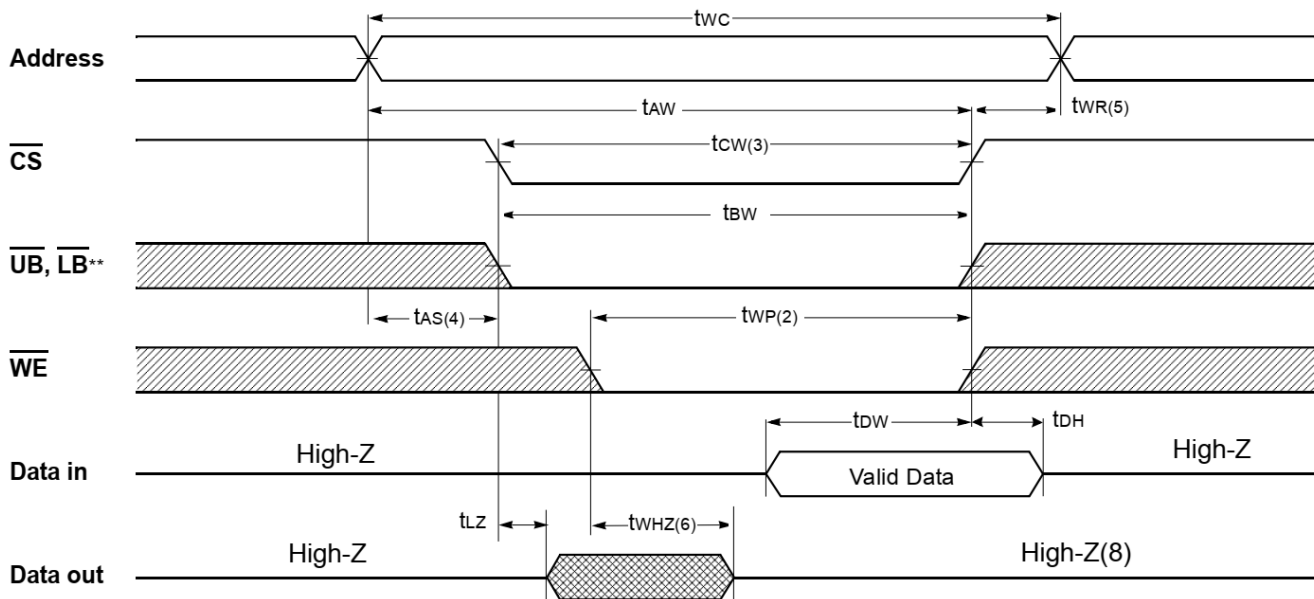

** Those parameters are applied for x16 mode only.

Timing Waveform of Write Cycle(1) (\overline{OE} Clock)

** Those parameters are applied for x16 mode only.

Timing Waveform of Write Cycle(2) (\overline{OE} = Low Fix)

** Those parameters are applied for x16 mode only.

Timing Waveform of Write Cycle(3) (\overline{CS} Controlled)

** Those parameters are applied for x16 mode only.

Timing Waveform of Write Cycle(4) (\overline{UB} , \overline{LB} Controlled)

Notes (Write Cycle)

1. All write cycle timing is referenced from the last valid address to the first transition address.
2. A write occurs during the overlap of a low \overline{CS} , \overline{WE} , \overline{LB} and \overline{UB} . A write begins at the latest transition \overline{CS} going low and \overline{WE} going low ; A write ends at the earliest transition \overline{CS} going high or \overline{WE} going high. tWP is measured from the beginning of write to the end of write.
3. t_{cw} is measured from the later of \overline{CS} going low to end of write.
4. t_{as} is measured from the address valid to the beginning of write.
5. t_{wr} is measured from the end of write to the address change. t_{wr} applied in case a write ends as \overline{CS} or \overline{WE} going high.
6. If \overline{OE} , \overline{CS} and \overline{WE} are in the Read Mode during this period, the I/O pins are in the output low-Z state. Inputs of opposite phase of the output must not be applied because bus contention can occur.
7. For common I/O applications, minimization or elimination of bus contention conditions is necessary during read and write cycle.
8. If \overline{CS} , goes low simultaneously with \overline{WE} going or after \overline{WE} going low, the outputs remain high impedance state.
9. D_{out} is the read data of the new address.
10. When \overline{CS} is low : I/O pins are in the output state. The input signals in the opposite phase leading to the output should not be applied.

** Those parameters are applied for x16 mode only.
