General Description

The device is a Spin-Transfer-Torque Magneto-resistive Random Access Memory (STT-MRAM). Data is always non-volatile and the device can replace FRAM, low-power SRAM or nvSRAM with same functionality and help to simplify system design. Due to the non-volatility and virtually unlimited endurance characteristics of STT-MRAM, it is suited for code storage, data logging, backup memory and working memory in industrial designs.

It is a fully random-access memory with parallel asynchronous interface. It supports the asynchronous page mode function to enhance the read and write performance. The page size is 8 words.

The S3R6416(V/R)1M is packaged in industrial standard 48FBGA. These package is compatible with similar low-power volatile and non-volatile products.

The device is offered with industrial (-40°C to 85°C) operating temperature range.

Pin	Type	Description
\overline{CS}	Input	Chip Select: When \overline{CS} is driven Low, read or write operation are initiated. When \overline{CS} is driven High, the device enters standby mode, and all other input pins are ignored and the output pins are tri-stated. \overline{CS} should be High at power-up to prevent abnormal write operation. This pin does not have internal pullup resistor.
\overline{WE}	Input	Write Enable: When \overline{CS} and \overline{WE} are driven Low, write operation is initiated. The rising edge of \overline{CS} causes the device to transfer the data to memory array. The rising edge of \overline{WE} latches the input data. And, the falling edge of \overline{WE} latches a new page address for write cycles.
\overline{OE}	Input	Output Enable
$A_{21} \sim A_0$	Input	Address The LSB address $A_2 \sim A_0$ are used for page mode read and write operation.

Power On/Off Sequence : 3.3V Device

- When power-up, power-down or power-loss, \overline{CS} must follow V_{cc} to provide data protection.
- It is recommended that \overline{CS} must follow V_{cc} when V_{cc} is below $V_{cc}(\text{minimum})$ and during t_{PU} .
- A 10K Ω pull-up resistor between V_{cc} and \overline{CS} pin is recommended.
- Normal operation must start after t_{PU} .

Device Operation

Read Operation : Interpage

Read operation is initiated when \overline{CS} goes to low and \overline{WE} is high. The falling edge of \overline{CS} latches the address and starts to read data from memory array. The output data are available after t_{CO} . The minimum random read cycle time is t_{RC} . The data remains in High-Z until the valid data is output.

Figure 5 : Timing Waveform of Read Cycle : x16 I/O mode

Page Mode Read Operation : Intrapage

The device supports the page mode read function to enhance the read performance. It reads a page data from memory array and latches the data into an internal page buffer.

The first data is output after t_{CO} . When the next page address is input, subsequent data is output from the page buffer after t_{PAA} .

The sequence and length of page address are not restricted.

For example, the sequence A2-A0-A1 is available.

Parameter	x16 I/O mode
Page Address	A ₂ -A ₀
Page size	8-word (16-bytes)

Figure 6 : Timing Waveform of Page Mode Read Cycle : x16 I/O mode

Address Access Read Operation

During \overline{CS} is low and \overline{WE} is high, if a random address (except for the page address) are changed, the device reads a page data from memory array of a new address and latches the data into an internal page buffer. The first data is output after t_{AA} . When the next page address is input, subsequent data is output from the page buffer after t_{PAA} . The random address transition time should not exceed t_{AX} .

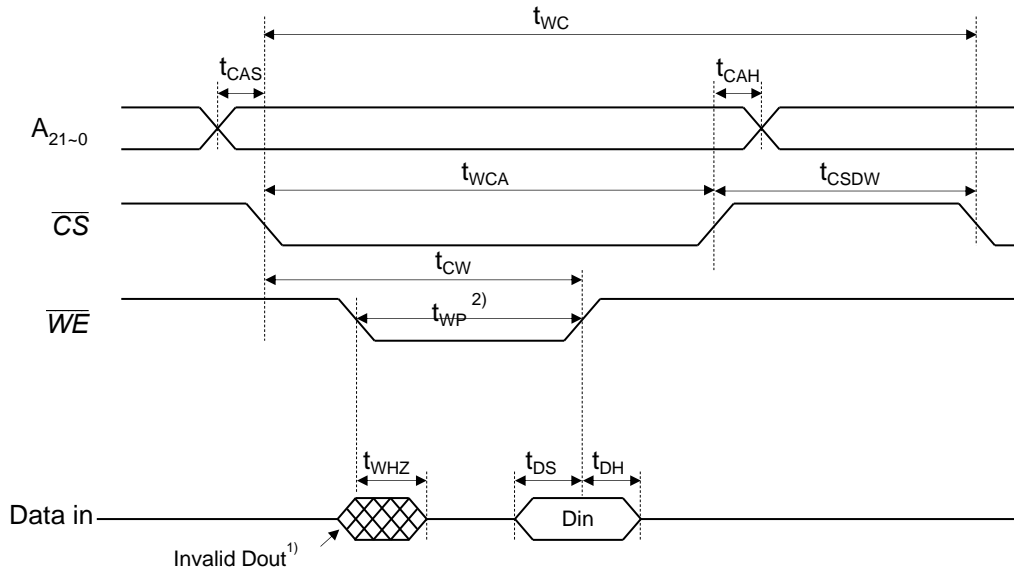

Figure 7 : Timing Waveform of Address Access Read Cycle : x16 I/O mode

Write Operation (\overline{WE} control) : Interpage

Write operation is initiated when \overline{WE} goes to low and \overline{CS} is low. The device latches address on the falling edge of \overline{CS} . It latches the data on the rising edge of \overline{WE} . The rising edge of \overline{CS} causes the device to transfer the input data to memory array.

Figure 8 : Timing Waveform of Write Cycle (\overline{WE} control) : x16 I/O mode

Notes :

1. The data pins remain in High-Z state if the time of \overline{CS} falling to \overline{WE} falling is smaller than 30ns or \overline{OE} is High.
2. In case that the data pins do not remains in High-Z state, t_{WP} should be t_{WP1}
3. $t_{WCA} + t_{CSDW} \geq t_{WC}$

Write Operation (\overline{CS} control) : Interpage

Write operation is initiated when \overline{CS} goes to low and \overline{WE} is low. The device latches address on the falling edge of \overline{CS} . It latches the data on the rising edge of \overline{CS} . The rising edge of \overline{CS} causes the device to transfer the input data to memory array.

Figure 9 : Timing Waveform of Write Cycle (\overline{CS} control) : x16 I/O mode

Page Mode Write Operation : Intrapage

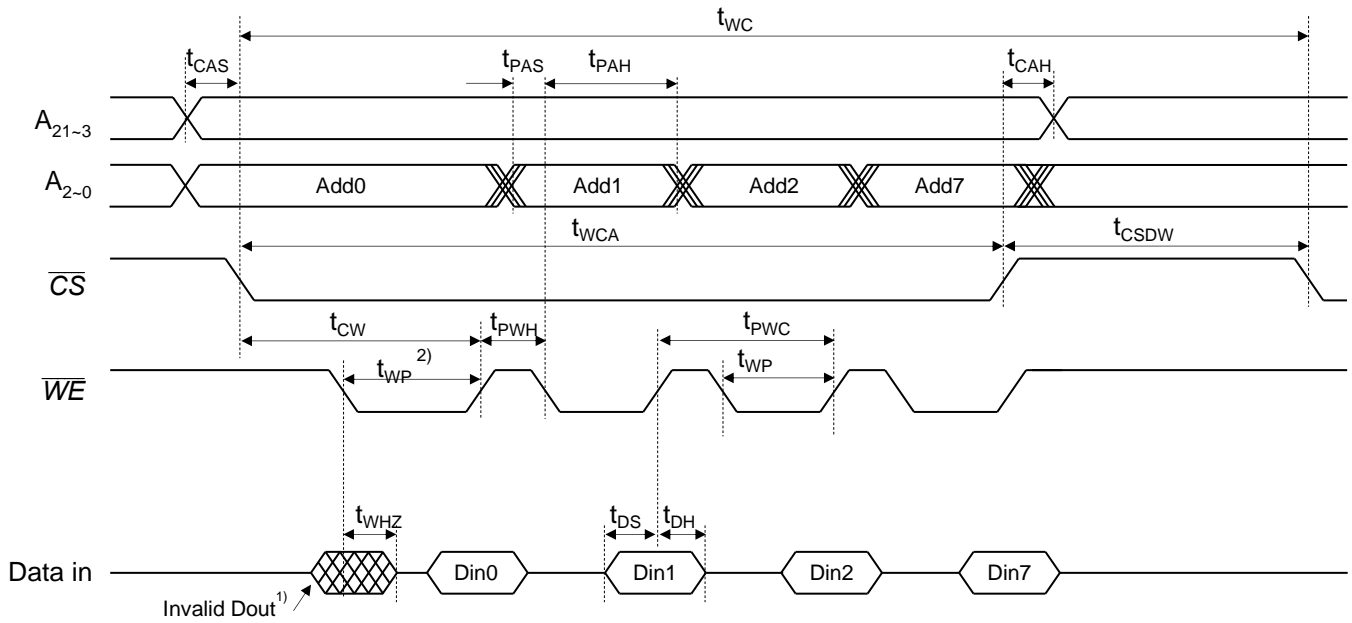

The device supports the page mode write function to enhance the write performance. It latches a page address every falling edge of \overline{WE} .

It latches the data on every rising edge of \overline{WE} . The rising edge of \overline{CS} causes the device to transfer the input data to memory array.

The sequence and length of page address are not restricted. For example, the sequence A2-A0-A1 is available.
